

CASE STUDY

Asso Divers

Strait of Gibraltar

480 mtr

Scope of Works

JFO removed rock armour and performed cable de-burial works on 33 locations along a 4km section of cable to allow for access to carry out inspection and essential repairs.

Working collaboratively with our customer to address the challenge of working at a depth of 480m and have the ability to manoeuvre and control the CFE for accurate excavation, we were able to provide an effective deep water CFE solution.

All 33 locations were cleared to the client specification and completed within the timeframe.

Scope of Supply

1 x T4000 CFE tool with MultiROV

The T4000 CFE tool provides a non-contact method of excavation with a remote control real-time sonar system and gyroscopic stability.

The MutliROV system is designed specifically to bring the benefits of CFE to deep water.
